Introduction:

A GUI-based Banking System that simulates basic banking operations like creating accounts, withdrawing and depositing money, checking balance, and adding interest for Savings accounts.

Our system is designed with ease-of-use in mind, offering a streamlined interface for automating essential banking operations.

Developed using J ava AWT (Abstract Window Toolkit), our system provides a comprehensive solution for managing finances.

Methodology

Core Java Concepts

- Object-Oriented Programming (OOP)
- Event handling using AWT and ActionListeners

GUI Design

- AWT components: Buttons, TextFields, Labels, TextAreas
- Custom styling for buttons and frame color

Main Functionalities

- Account creation with user input validation (PIN, phone number)
- Withdrawal, deposit, balance check
- Interest addition for Savings accounts

Output (New balance)
Balance Check

Results and Snapshot

Welcome Screen

The welcome screen displays buttons for various banking operations.

Account Creation Form

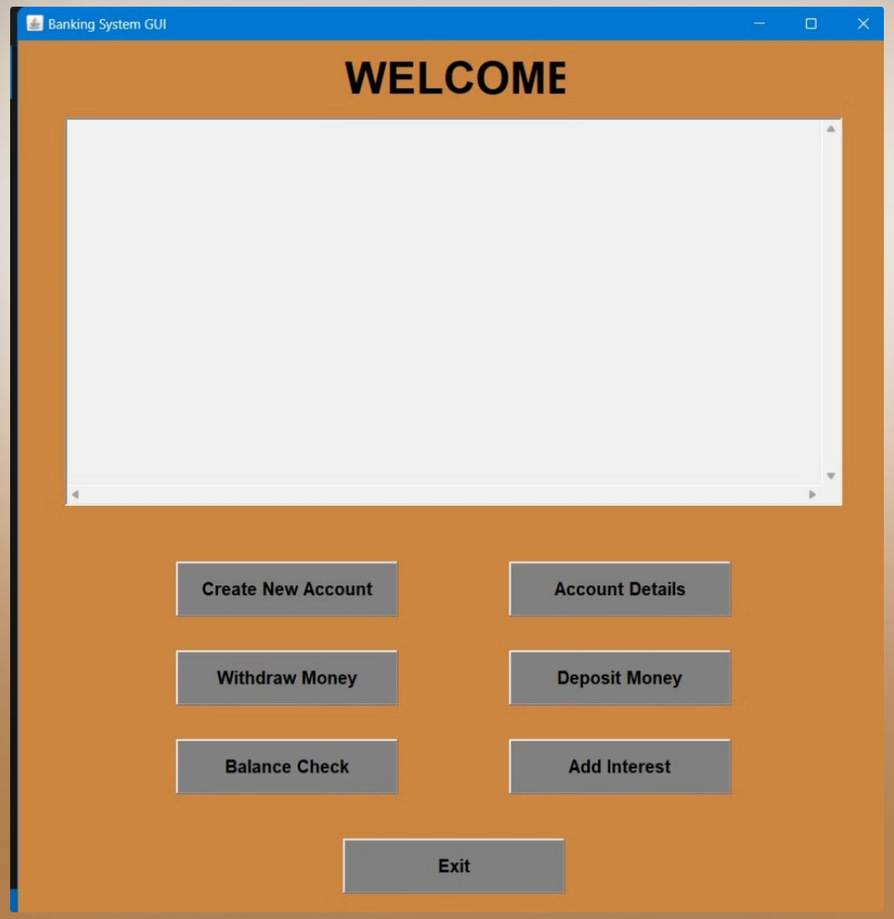
The account creation form allows users to input their details and create a new account.

Successful Transaction Messages

The system displays messages confirming successful transactions.

Display of Account Details and Balance

The system displays the user's account details and current balance.



Limitations

No connection to a real database

Data is not persistent after the application closes.

Limited security measures

Basic PIN validation.

Simplistic error handling

Input validation could be more robust.

Made with Gamma

Future Scope

1

Database Integration

Store user data in a database for persistence and security.

2

Security Improvements

Implement advanced encryption for PINs and transactions.

3

Mobile App Development

Extend the project to create mobile-friendly versions using JavaFX or Android.

4

Advanced Features

Add more banking features like loan management, fund transfers, etc.
